Controlling the UI Language of SmartWorks TOUCH

Operating System Controlled UI Language

SmartWorks TOUCH attempts to match the language of its interface to the language used by the logged-in user each time it is run. If the pc is being used in one of the 11 languages listed below SmartWorks TOUCH will automatically attempt to switch to the same language. No provision is made in the program for the user to control the language setting from the interface.

Language Not Supported Option

If the language of the host computer is not one of the 11 standard languages SmartWorks TOUCH will automatically display the language chooser dialogue (below). If the user chooses a language from the list the program will change to the new language when it is next restarted. If the user fails to choose a new language but instead clicks the green check button the program will default to Bulgarian, the first language in the list.

Controlling Program UI Language Externally (Administrator)

If SmartWorks TOUCH fails to detect a compatible language a control file iniLang.txt is automatically placed in the user local directory C:\Users\user\AppData\Local\Colortrac\Touch. The contents of this file will normally cause the program to run in Bulgarian (as above).

When SmartWorks TOUCH has started normally and successfully aligned its UI language to the operating system the UI language can still be manually switched to a different language as long as it is in the supported list. Simply create a text file called iniLang.txt file in the user local program folder containing the desired language ID to force the language to be used next time the program is restarted.

To change back to the same language as the operating system simply remove the iniLang.txt or change the language ID inside to be the same as the operating system.

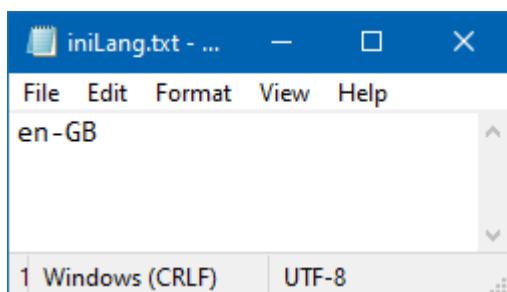

External UI Language Control for Multiple Users

SmartWorks TOUCH control over UI language extends only to each logged-in user, there is no provision to set the language for all users. For different users having a separate login on the same computer but all wishing to use the program with a UI language different to the host operating system, it will be necessary to manually place copies of the **iniLang.txt** file (with the appropriate language ID) in the **AppData\Local\Colortrac\Touch** folders for each user.

11 languages:

	Language	Language ID
1	Bulgarian	bg-BG
2	German	de-DE
3	US English	en-US
4	UK English	en-GB
5	Spanish	es-ES
6	French	fr-FR
7	Italian	it-IT
8	Japanese	ja-JA
9	Korean	ko-KR
10	Polish	pl-PL
11	Chinese	zh-CN

The language that SmartWorks TOUCH displays can be changed to a different language from the operating system by inserting the required language ID in the iniLang.txt file and placing this in the local AppData folder. The iniLang.txt file will not exist if the Windows language in use on the computer was one of the SmartWorks TOUCH supported languages and instead will have to be created. Use Notepad or Windows File Explorer to make the file and then enter the required language ID.

END
